Home Work Week 3

Create an empty text file on your hard drive.

Create a python script that takes 3 extra arguments.

Each time the script is called create a dictionary to store the arguments.

Open the text file you created in the python code.

If the file is empty then create a list and add the dictionary of arguments to it and then save the new list to the file.

If the file already has data saved to it then read the file and convert back to a list and append the new dictionary to it.

Finally close the file.
